

asgn11 - Admin to users

Objectives

- Create a hashed password
- Use arrays to create tables.
- Add validation
- Continue with Git and GitHub
- Continue uploading code to your Webhost

Introduction

Watch all of the videos for Chapter 5. Code along with Kevin as much as possible. There are a couple of segments where he provides a large chunk of code. I recommend copying and pasting those.

Kevin Skoglund introduces creating an `admins` table and adding it to bikes. In the future, we will need more flexibility but we will use his tutorial as is for this assignment.

Remember that you can use the SQL tab in PHPMyAdmin instead of the CLI to perform all of your SQL commands.

Setup

Create a new folder called **asgn11-admins** and follow along with the tutorial.

Git

Be sure to use Git and a `dev` branch.

Webhost

Upload to your webhost and test the code.

Submit your work

Create a text file named **asgn11-yourLastName.txt** and enter your GitHub and Webhost addresses.

Submit the text file in Moodle.
